```
The present sequence represents a cancer peptide that is based on amino acid residues 44-62 of human ESO-1/CMG-3 (or CMG-3) ORF1 (see AAY05965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells, Cancer peptides derived from CMG-3 ORF1, CMG-3 ORF2 (see AAY05966), portions of them and their variants (see AAY05967-87), are useful as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal, antisense oligonucleotides that inhibit expression of the cancer peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NY ESO-1/CAG-3 gene; CAG-3 gene; cancer peptide; antigen; human; leukaemia; non-Hodgkins lymphoma; Hodgkins lymphoma; lung cancer; metaetsais; melanoma; adenocarcinoma; thymoma; colon cancer; uterine cancer; breast cancer; prostate cancer; ovarian cancer; cervical cancer; bladder cancer; kidney cancer; pancreatic cancer; liver cancer; sarcoma; tumour; diagnosis; immunotherapy; therapy;

addition, the invention may allow development of a vaccine. The invention is useful for identifying a polypeptide suitable for epitope libration, where the epitope is a housekeeping epitope. The compositions comprising the identified housekeeping epitopes are useful in vitro in vaccine development or in the generation or expansion of cytotoxic T lymphocyte (CTL) to be used in adoptive immunotherapy. The invention is also useful for activating T-cells against neoplastic cells, and cells infected with virus, bacterium, protozoan or fungus. CTL epitopes are identified based on the knowledge that such epitopes are, in fact, produced by the housekeeping proteasome system. Once identified, these epitopes, embodied as peptides, can be used to successfully immunise or induce therapeutic TL responses against housekeeping proteasome expressing target cells in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated cancer associated antigen - is used to develop products for the diagnosis and treatment of cancers and for monitoring cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present sequence represents a cancer associated antigen. The clone from which the DNA sequence is obtained is designated NY-ESO-1. The specification described a method for determining regression, progression of onset of a cancerous condition, comprising monitoring a sample from a patient with the cancerous condition, for a parameter selected from NY-ESO-1 protein, a peptide derived from NY-ESO-1 protein and cytolytic T cells specific for the peptide and an MHC molecule with which it non-covalently complexes. Methods for the treatment of a cancerous condition are also described. The NY-ESO-1 protein and peptides derived from it can be used for diagnosis and treatment of cancers and to monitor the efficacy of a therapeutic regime Sequence 180 AA;

particularly tumours.

The present sequence represents human NY-ESO-1, formerly known as Li-1.2 clone, which is used in an example from the present invention which describes LAGE-1 tumour associated protein (TAP). The present invention also describes: (1) a method for treating a subject with a disorder characterised by expression of a LAGE-1 nucleic acid molecule or an expression product, comprising administering to the subject autologous cytolytic T cells to ameliorate the disorder, where the cytolytic T cells for complexes of an HLA molecule and a LAGE-1 TAP or an immunogenic fragment; (2) a method for treating a subject with a disorder characterised by expression of a LAGE-1 uncleic acid molecule or an expression product, comprising administering a LAGE-1 TAP or an immunogenic fragment to ameliorate the disorder; and (3) a method for

```
The present sequence represents the ORF1 protein encoded by open reading frame 1 of the human ESO-1/CAG-3 (or CAG-3) gene. CAG-3 is a new and protein tumour antigen capable of eliciting an antigen specific immune response by T calls. Cancer peptides comprising ORF1, ORF2 (see AAY05966), portions of these peptides and their variants (see AAY05965-87), are useful as cancer vectines that proteic the recipient from development of cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antiennes oligonucleotides that inhibit expression of the cancer peptide or tumour antigen; antibodies reacting with the CAG-3 cancer peptide, useful in diagnostic and detection assays; and methods of the cancer peptide. The cancer peptide, cancer peptide, useful in diagnostic and detection assays; and methods of the cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer,
                                                                                                                                                                                                                                                         ö
selectively enriching a population of T cells with cytolytic T cells specific for a LAGE-1 TAP comprising contacting an isolated population of T cells with an agent presenting a complex of a LAGE TAP or an immunogenic fragment and a HLA presenting molecule to selectively enrich the isolated population of T cells with the cytolytic T cells. The methods and products from the present invention can be used for the diagnosis and treatment of LAGE-1 associated disorders, particularly

This sequence represents a human tumour antigen, NY-ESO-1, the CDNA encoding which was isolated from an oesophagus squamous cell cancer cDNA library. Tissue localisation studies revealed it to be expressed at high levels in normal ovary and testis but not in normal colon, kidney, liver, brain, oesophagus and skin. It was expressed in certain tumours and tumour cell lines with some degree of frequency - these included melanoma specimens and cell lines, and breast and bladder cancer specimens, with expression in other tumour types baing sporadic. Peptides derived from NY ESO-1 are bound by both MHC (major histocompatibility complex) Class I can class II molecules for presentation to T-cells. Peptides AAY52431-CY52434 bind to Class I HIA-AZ molecules, thereby stimulating proliferation of cytotoxic T-cells, while peptides AAY52435-Y52440 bind to class II HIA-DRS3 molecules, than while peptides and proliferation. The peptides derived from NY-BSO-1 may be used in methods and cancers compositions used for the treatment, diagnosis and prevention of cancers (such as melanoma, breast cancer, prostate cancer, lung cancer, hepatoma,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the human NY-ESO-1 protein, a tumour antigen, identified by screening an esophagus carcinoma cDNA library. This protein is derived from open reading frame (ORF) -1 that contain epitopes of tumour specific T-cells. NY-ESO-1 is expressed in different tumour types, but not in healthy tissues except in testis. It also shows homology with protein, a tumour-asociated antigen. The CAMEL (Cytocoxic T lymphocytes (CTL) recognised Antigen on MELanoma) protein, a tumour-asociated antigen. The tumour-associated antigen and displayed on melanoma cells is recognised by cytotoxic T lymphocytes. This sequence has anticancer activity. CAMEL tumour antigen and immunogenic peptides derived from it are useful for cancer immunotherapy. They have the potential to induce an immune response, by eliciting a CTL response. The DNA molecule is used for the construction of recombinant or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NY-ESO-1; CAMEL, CTL-recognised Antigen on MELanoma; human; cancer; CTL; cytotoxic T lymphocyte; tumour-associated antigen; LAGE-1; anticancer; melanoma; immunotherapy; immune response.

This sequence represents a human oesophageal cancer-associated antigen, NY-ESO-1. The CDNA encoding this sequence was isolated from a CDNA library prepared from a specimen of well-to-moderately differentiated squamous cell cancer of the oesophagus. Expression analysis demonstrated that NY-ESO-1 was expressed in oesophageal carcinoma, certain melanoma coll lines and in normal ovary and testis tissue, but not in normal colon, kidney, liver or brain tissue. Analysis of the amino acid sequence of the protein indicates that the protein has a transmembrane domain, several N-myristcylation sites and O-phosphorylation sites and that it contains antigenic sequences in the N-terminal half of the protein. The antigen is useful as an immunogen when combined with an adjuvant, in both precursor and post-translationally modified forms, and may be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated esophageal cancer-associated antigen useful as markers for producing antibodies and as targets for identifying abnormal conditions, e.g. infections and cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is human NY-ESO-1 protein. It is provided in a specification relating to a method for determining the status of a cancerous condition in a patient with a tumour that expresses NY-ESO-1. The method comprises assaying a sample taken from the patient for antibodies that specifically bind to the NY-ESO-1 and comparing the value obtained to a prior value obtained from assay of a prior sample taken from the patient. Any difference between the values is indicative of a change in status of the cancerous condition. The method is useful for determining whether a cancerous condition is progressing or remaining stable, in particular in patients receiving treatment for a melanoma, adenocarcinoma, non-small cell lung carcinoma or bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Method useful for determining the status (e.g. progression, regression or stability of the disease) of a cancerous condition, involves determining the levels of NY-ESO-1 specific antibodies in a sample taken from a patient.
generate anti-NY-ESO-1 antibodies. It can also be used as a diagnostic marker for oseophageal cancer, and can be utilised as a marker for the targetted delivery of therapeutic agents to oseophageal cancer cells. I can also be used to generate diagnostic or therapeutic agents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents cancer testis tumour antigen NY-ESO-1 (also called LAGE-2). NY-ESO-1 is a molecule that is processed to at least one human leukocyte antigen (HLA) binding peptide, which binds to class I and Class II major histocompatibility complex (MHC). NY-ESO-1 is expressed in tumour mRNA and in testis, but not normal colon, kidney, liver or brain tissue. The presence or level of expression of NY-ESO-1 may be assayed for the diagnosis of cancer, especially testis tumours
                                                                                                                                                                                                                                                                                                                                             Cancer testis tumour antigen; NY-ESO-1; LAGE-2; human leukocyte antigen; HLA; HLA binding peptide; major histocompatibility complex; MHC; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genomic sequences of tumor associated antigen EY-ESO-1 (LAGE-2) useful for diagnosing testicular tumors.

AAE07714;

Human NY ESO-1 protein.

```
The sequence represents a human NY-ESO-1 tumour rejection antigen

precursor. NY-ESO-1 and SSX-2 polypeptides, or fragments of, bind to

major histocompatibility complex (MHC) Class II molecules such as human

leukocyte antigen-determining region (HLA-DR) molecules and stimulate

proliferation of helper T cells. The peptides can be administered to an

HLA-DR positive subject in order to stimulate the helper T cells. An MHC

CLASS II HLA-DR-NY-ESO-1/SSX-2 complex expressed on the surface of a cell

CO present in free form is useful for this stimulation. The nucleic acid

is useful for screening for a cancerous condition, which involves

CO contacting a subject sample to a cell line transfected with the

immunoreactive cell (helper T cell), where interaction is indicative of

cancer. In addition, a sample from a patient (for example, a body fluid

or tissue) can be monitored for the amount of the complex present in the

CL onset of a cancerous condition. The method involves contacting the sample

with a radioactive labelled or enzyme labelled monoclonal antibody which

specifically binds with the complex
                 human leukocyte antigen-determining region; disease progression;
disease regression; disease onset; body tissue; body fluid; enzyme label;
radioactive label; monoclonal antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptides binding to major histocompatibility complex class II human leukocyte antigen-determining region molecule having amino acid sequence found in tumor rejection antigen precursor used for stimulating proliferation of helper T cells.

The invention relates to the identification and isolation of major histocompatibility (MHC) class II restricted T cell epitope (MHC-II epitopes) darived from the cancer antigen, NY 850-1. The MHC-II epitopes from NY 850-1 are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DP creatisticted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in a mammal by eliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of calls expressing the NY-BSO-1 gene product. The cancer peptides are also useful as diagnostic agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given target antigen and/or hapten and to induce tumour-specific humoral-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mediated immunity against cancer. The present sequence is human NY ESO-1

```
The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relatives to their linked in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polypeptides. The synthetic polypeptides and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polymucleotides or are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breat, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, coscophagus, brain, testicle, uterus), as potentiating agents.

Compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HIV (human comprising the polypeptide syncytial virus), bacterial color, infections caused by Neisseria, Meningococcal, Haemophilus, color, infections caused by Plasmodium, Schistosoma, Iteishmania, color, infections caused by Plasmodium, Schistosoma, Leishmania, constituted in a parent protein used to design a savine of the invarious.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New synthetic polypeptides having several different segments of at least one parent polypeptide linked together differently compared to the linkage in the parent polypeptide, for inducing immune response against a

The invention relates to a vaccine comprising a first housekeeping epitope derived from a first antigen associated with a first target cell. Also included are an isolated T cell expressing a T cell receptor an isolated T cell expressing a T cell receptor period of peptide from a first target cell, selecting an epitope (or antigen associated with a first target cell, selecting an epitope (or antigen associated with a first target cell, selecting an epitope (or peptide sequence) from a population of peptide fragments have a known or predicted affinity for a MRC receptor peptide binding cleft of the host, where the epitope selected corresponds to a product of proteolytic comprises a first sequence encoding at least a first polypeptide, where the first polypeptide comprises a first housekeeping epitope derived from comprises a first bounding at least a first polypeptide, where the first polypeptide comprises a first housekeeping epitope derived from a first antigen associated with a first target cell; The epitopes, or medicament for use in adoptive immunotherapy and for prevention and treatment of neoplastic and viral diseases (e.g. human immunodeficiency virus, Huy, infection, hepatitis virus and papilloma virus), cancers (e.g. tumours, leukeamia, lymphoma, breast cancer, prostate cancer and lung cancer), infection of cells by intracellular parasites (e.g. the powers leukemia, Trypanosoma and Toxoplasma) and many other examples given in the specification. The invention permits the vaccine design. The cover be useful because they cannot be presented by target cells. The peptides that, despite predicted high binding affinity for MRC, will never be useful because they cannot be presented by target cells. The immunology. The invention allows for the simple and effective selection of immunology the antigen presenting contents of meaningful epitopes for creation of MRC class I or Class I or Class II vaccines contenting provides an HIA-A2.1 (human leukoyte entigen) presenting

                                                                                                                                                                                                                       유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-regulated in specific cancers (e.g. about 1031 genes up-regulated in acute lymphocytic leukemia). ACC72641 to ACC72860 represent cancer clated gene nucleotide sequences which encode the proteins given in ABRS8521 to ABRS8709. Also described: (1) determining the presence or ABRS8709. Also described: (3) an expression vector comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid; (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a drug screening assay. The nucleic acid is useful as diagnostic markers or therapeutic targets. In particular, the nucleic acid is useful for therapeutic targets. In particular, the nucleic acid is useful for diagnosing a pathology, e.g. cancer (e.g. cancer of the bone marrow, bladder, brain, breast, cervix, colon/rectum, kidney, lung, ovary, particular, skin and uterus), wounds, ischaemia, heart diseases,

cytochrome-c oxidase (EC 1.9.3.1) chain Vb precursor - rat
N;Alternate names: cytochrome-c oxidase (EC 1.9.3.1) chain VIa*
C;Species: Rattus norvegicus (Norway rat)
C;Date: 28-Oct-1994 #sequence revision 26-May-1995 #text_change 09-Jul-2004
C;Accession: JC2254; JC2255; $05318; $65375
C;Accession: JC2254; JC2255; $05018; $65375

"A hydroxylase-like gene product contributes to synthesis of a
polyketide spore pigment in Streptomyces halstedii.";
J. Bacteriol. 175:8043-8048(1993).
-!- FUNCTION: Involved in developmentally regulated synthesis of a
compound biosynthetically related to polyketide antibiotics which
is essential for spore color in Streptococcus coelicolor.
-!- COPACTOR: FAD (By similarity).
-!- SIMILARITY: Belongs to the pheA/tfdB FAD monooxygenase family.

Mol. Pharmacol. 40:168-179(1991).

-i-FUNCTION: Alpha-2 adrenergic receptors mediate the catecholamine-induced inhibition of adenylate cyclase through the action of G proteins. The rank order of potency for agonists of this receptor is oxymetazoline > clonidine > epinephrine > norepinephrine >
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   phenylephrine > dopamine > p-synephrine > p-tyramine > serotonin = p-octopamine. For antagonists, the rank order is yohimbine > phentolamine = mianserine > chloupromazine = spiperone = prazosin > propanolol) > alprenolol = pindolol. SUBCELLULAR LOCATION: Integral membrane protein. SIMILARITY: Belongs to the G-protein coupled receptor 1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MUTACENESIS OF ASPARTIC ACID AND SERINE RESIDUES.

S-palmitoyl cysteine (By similarity).
Implicated in ligand binding.
Implicated in actechol agonist binding and receptor activation.
Implicated in catechol agonist binding and receptor activation.
N -> K (rare polymorphism; frequency in caucasians 0.004 and in African-Americans 0.05; 40% increase in agonist-promoted Gi coupling; dbSNP:1800035).
/FTIG=VAR 014957.
D-N: No Change in binding affinity, eliminates guanine nucleotide-sensitive agonist binding.
                                                                                                                                 R PROSITE; PROJOZJ7; G-PROTEIN_RECEP F1 1; 1.

Zinc finger A20 domain containing protein ? (BC 3.-.-.-) (Zinc finger
                                                                                                                                                                                                      Evans P.C., Coadwell W.J., Kilshaw P.J.;

"Isolation of a novel murine gene, Cezanne 2.";

Submitted (PEB-2002) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Has deubiquitinating activity that is directed towards Lys-48 or Lys-63-linked polyubiquitin chains. Hydrolyzes both linear and branched forms of polyubiquitin (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).

-!- SIMILARITY: Contains 1 A20-type zinc finger.

-!- SIMILARITY: Contains 1 A20-type zinc finger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MEROPS; C64.002; -.                                                                                                                                                                   Rehbein M., Wege K., Buck F., Schweizer M., Richter D., Kindler S.;
"Molecular characterization of MARTAL, a protein interacting with the
domedritic targeting element of MAP2 mRNAB.";
J. PUNCTION: Part of a ternary complex that binds to the downstream
control sequence (DCS) of the pre-mRNA. Mediates exon inclusion in
transcripts that are subject to tissue-specific alternative
splicing. May interact with single-stranded DNA from the far-
upstream element (FUSE). May activate gene expression (By
almilarity). Binds to the dendritic targeting element and may play
a role in mRNA trafficking.
                                                                                                                                                                                                                                                                                                                                               -!- SUBUNIT: Part of a ternary complex containing FUBP2, PTBP1, and HNRPH1 (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear. A small proportion is also found in the cytoplasm of neuronal cell bodies and dendrites.
-!- SIMILARITY: Contains 4 KH domains.
                                                                                                     SEQUENCE FROM N.A., SEQUENCE OF 73-87; 89-108 AND 475-486, SUBCELLULAR LOCATION, AND FUNCTION.

Sequence 8, Application US/08937263B

Patent No. 6274145

GENERAL INFORMATION:

APPLICANT: Chen, Yao-Tseng; Scanlan, Matthew;

APPLICANT: Gure, Ali; Old, Lloyd J.; Jager, Blke;

APPLICANT: Alexander, Knuth; Drijfhout, Jan W.

TITLE OF INVENTION: ISCOLATED NUCLEIC ACID MOLECULE

TITLE OF INVENTION: ITSELF, AND USES THEREOF

NUMBER OF SEQUENCES:

CORRESPONDENCE ADDRESS:

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYWORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

FILE REPERENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR PELILNG DATE: 2000-10-20

PRIOR FILING DATE: 2000-10-20

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOFTWARE: PSEC FOR Windows Version 4.0

This sequence represents cancer peptide ESO10-127 that corresponds to amino acid residues 127-136 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAY05965), a new and potent tumour antigen capble of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAY05966), portions of them and their variants (see AAY05967-87), are useful as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide or tumour antigen; antibodies reacting with a CAG-3

The present peptide (ranked 1) corresponds to amino acid residues 127-136 of CAG-1 ORF1 (see AAY05965). CAG-1 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAY05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, ilver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers
          for preventing or inhibiting cancer by administering a cancer peptide, with or without an HiA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is treated by inducing cancer-specific T cells in vitro for subsequent
cancer peptide, useful in diagnostic and detection assays; and methods

The invention relates to the identification and isolation of major
histocompatibility (MHC) class II restricted T cell epitope (MHC-II
epitope) derived from the cancer antigen, NY ESO-I. The MHC-II epitopes
from NY ESO-I are recognised by CD4+ T lymphocytes in an human leucocyte
antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DR
restricted. The products of the gene are promising candidates for HLA-DR
restricted. The products of the gene are promising candidates for
munocherapeutic strategies for the prevention, treatment and diagnosis
of patients with cancer. The cancer epitopes are useful as immunogen and
vaccine to inhibit or to prevent cancer in a mammal by eliciting CD4+ T
lymphocytes resulting in protection of the recipient from development of
cancer and protection from metastasis, or by inhibiting the growth of
cancer and protection from metastasis, or by inhibiting the growth of
cancer and protection of the recipient from development of
useful as diagnostic agent to detect the presence of cancer, to enhance
the generation of antibody and/or CD8+ T cell responses against any given
carget antigen and/or hapten and to induce tumour-specific humoral-
mediated immunity against cancer. The present sequence is human NY ESO-I
peptide used in the characterisation of the NY ESO-I epitope recognised
                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New NY-ESO cancer peptide or MHC class II restricted T cell epitopes, useful as immunogen and vaccine for inhibiting cancer in a mammal or as
                                                                                                                                                                                                                                                                                                                                                                                           Human NY ESO-1 peptide #22 to characterise epitope recognised by TE4-1.
                                                                                Gaps

The invention relates to the identification and isolation of major histocompatibility (MHC) class II restricted T cell epitope (MHC-II epitope) derived from the cancer antigen, NY ESO-I. The MHC-II epitopes from NY ESO-I are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HHA) class II restricted manner, in particular HLA-DR or HLA-DP restricted. The products of the gene are promising candidates for immunocherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in ammmal by eliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection of an analysis of the generation of the cancer peptides are also useful as diagnostic agent to detect the presence of cancer, to enhance the presence of cancer peptides are also the generation of analysis of the generation of analysis of the generation of analysis of the generation of any of the growth of the generation of analysis of the generation of any of the growth of the generation of any of the generation of any of the generation of the cancer peptides are also the growth of the generation of any of the generation of any of the growth of the generation of any of the generation of any of the growth of the growth of the growth of the generation of any of the growth of the

histocompatibility (MHC) class II restricted T cell epicope (MHC-II epitope) derived from the cancer antigen, NY ESO-1. The MHC-II epitopes from WR ESO-1 are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DR restricted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in a mammal by eliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of calls expressing the NY-ESO-1 gene product. The cancer peptides are also useful as diagnostic agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given target antigen and/or hapten and to induce tumour-specific humoral-mediated Immunity against cancer. The present sequence is MHC class II restricted T cell epitope of human NY ESO-1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the identification and isolation of major histocompatibility (MHC) class II restricted T cell epitope (MHC-II epitopes) derived from the cancer antigen, NY ESO-1. The MHC-II epitopes from NY ESO-1 are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DP restricted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in ammmal by eliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection of each trocker. The cancer peptides are also useful as diagnostic agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given target antigen and/or hapten and to induce tumour-specific humoral-mediated immunity against cancer. The present sequence is MHC class II restricted T cell epitope of human NY ESO-1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                             New NY-ESO cancer peptide or MHC class II restricted T cell epitopes, useful as immunogen and vaccine for inhibiting cancer in a mammal or as protection from metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
